DESIGN REVIEW — FINAL LAYOUT

One decision record, five tabs, every number traceable

A reorganization of Thrive Alpha around the thing that already makes it trustworthy — a single computed verdict per ticker — instead of letting six separate screens each show their own opinion of it. Built from the wireframe PDF, then checked line-by-line against the real dashboard and ticker-detail code so nothing live gets dropped on the way to something cleaner.

Status Final layout, revised post-codebase-audit, ready to build

Source Thrive Alpha Wireframes.pdf + full dashboard & ticker-detail component inventory

Scope Mobile layout shown · desktop strategy in prose

Why | Nav: 8→5 | Screens | Desktop | What's new | Codebase audit | Build sequence

01 What each platform actually does well

Not a moodboard — six specific mechanics, each borrowed because Thrive Alpha already has the backend data to earn it, not because it looked good somewhere else.

BLOOMBERG TERMINAL

One record, many views. Verdict, Why, and Levels never recompute independently — they render three facets of the same decision object. This session's bugs (entry bands disagreeing across tabs, gate status flipping between Signals and ticker detail) were exactly what happens when that discipline slips.

ROBINHOOD

A plain sentence before any number. "Wait. Don't buy today." reads before $535.07 or any gate. The number backs up a sentence a retail trader already understands, not the other way around.

THINKORSWIM

Readiness tiers, not just a score. Tactical / Almost ready / Warming groups signals by

INTERACTIVE BROKERS

Sizing tied to your real book. A suggested add that's computed against your actual

Almost ready / Warming groups signals by how close they are to actionable — a gate progress bar reads faster than a raw score, and never contradicts the gates underneath it.

add that's computed against your actual portfolio value and existing position — not an illustrative $50,000 — and respects the same concentration cap Portfolio already enforces.

TRADINGVIEW

Regime as a persistent strip, not a badge you have to hunt for. A thin Up/Caution/Down band under the price chart keeps market context visible while you're reading levels, instead of a separate fact you have to remember.

PUBLIC.COM

Catalysts are dated and named, not vibes. "Earnings in 17 days" and "beat estimates 4 of last 4 quarters" are specific, checkable facts attached to the price — not a generic sentiment score.

02 Navigation: 8 tabs become 5

The PDF's split is right and keeps it: anything that helps a decision stays in the main nav; anything that validates the model itself (data freshness, regime audit) moves to `Admin` inside More, read-only on mobile. Revised against a full pass of the real codebase (see Codebase audit) — two rows below read differently than the first draft.

OLD	NEW	CARRIES
Main (incl. Alerts card)	**Today**	Since-yesterday diffs, My book, market-weather teaser, calendar, catalyst feed. Bell icon opens Alerts full-screen — promoted out of this feed, not built new.
Mkt	**Today's weather strip → push to full Markets screen**	Teaser only in the feed; tapping it opens the real depth unchanged — cross-asset (DXY/GLD/USO/VIX/10Y), next-day outlook, pre-market engine, breadth/rotation, market scenarios, crypto, econ calendar. Nothing here moves to Admin, it's all decision-relevant.
Signals	**Signals**	Hunter / Scanner / Heatmap **/ Roadmaps**, readiness tiers, one Filters sheet. Roadmaps added back as a 4th sub-tab —

		see below.
Roads	**Split: cross-ticker view → Signals' new Roadmaps sub-tab · single-ticker depth → Ticker detail's Levels tab**	The standalone tab's real job is comparing roadmaps across many tickers at once — Signals is the right home for that scan. The deeper per-ticker roadmap (HorizonPlaybooksPanel, TradeRoadmapCard) was always richer inside ticker detail and stays there.
Opps + Income	**Plan**	Goal, feasibility from real hit-rate, progress tracking, candidate pool and proposed trades — Income's real depth, not just a feasibility bar.
Port	**Portfolio**	Real concentration, correlation, real sizing, **+ Risk Management** (VaR/CVaR, stress scenarios, drawdown sim) **+ Tax-Aware Exit Optimizer + Decision Journal** — three real features the first draft had no home for. Canonical home for Portfolio Summary/Regime Chart; Today keeps only a one-line teaser (today both tabs show the full card verbatim — a duplication bug, fixed here).
Data	**More →** `Admin`	Data health, model-version audit, signal-audit job status, **+ FMP Plan Status** (relocated off the retail Overview tab) **+ regime_validation** (fetched today but never rendered anywhere — surfaced here instead of silently dropped).

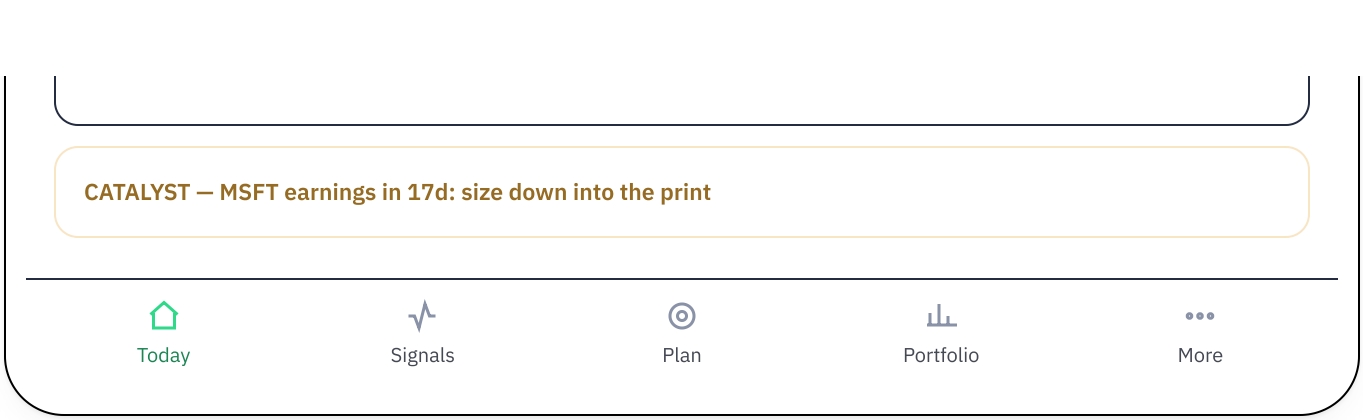

03 The five screens

Built mobile-first at the wireframe's own width. The ticker-detail tabs below are live — click Verdict / Why / Levels / News / Track.

Today

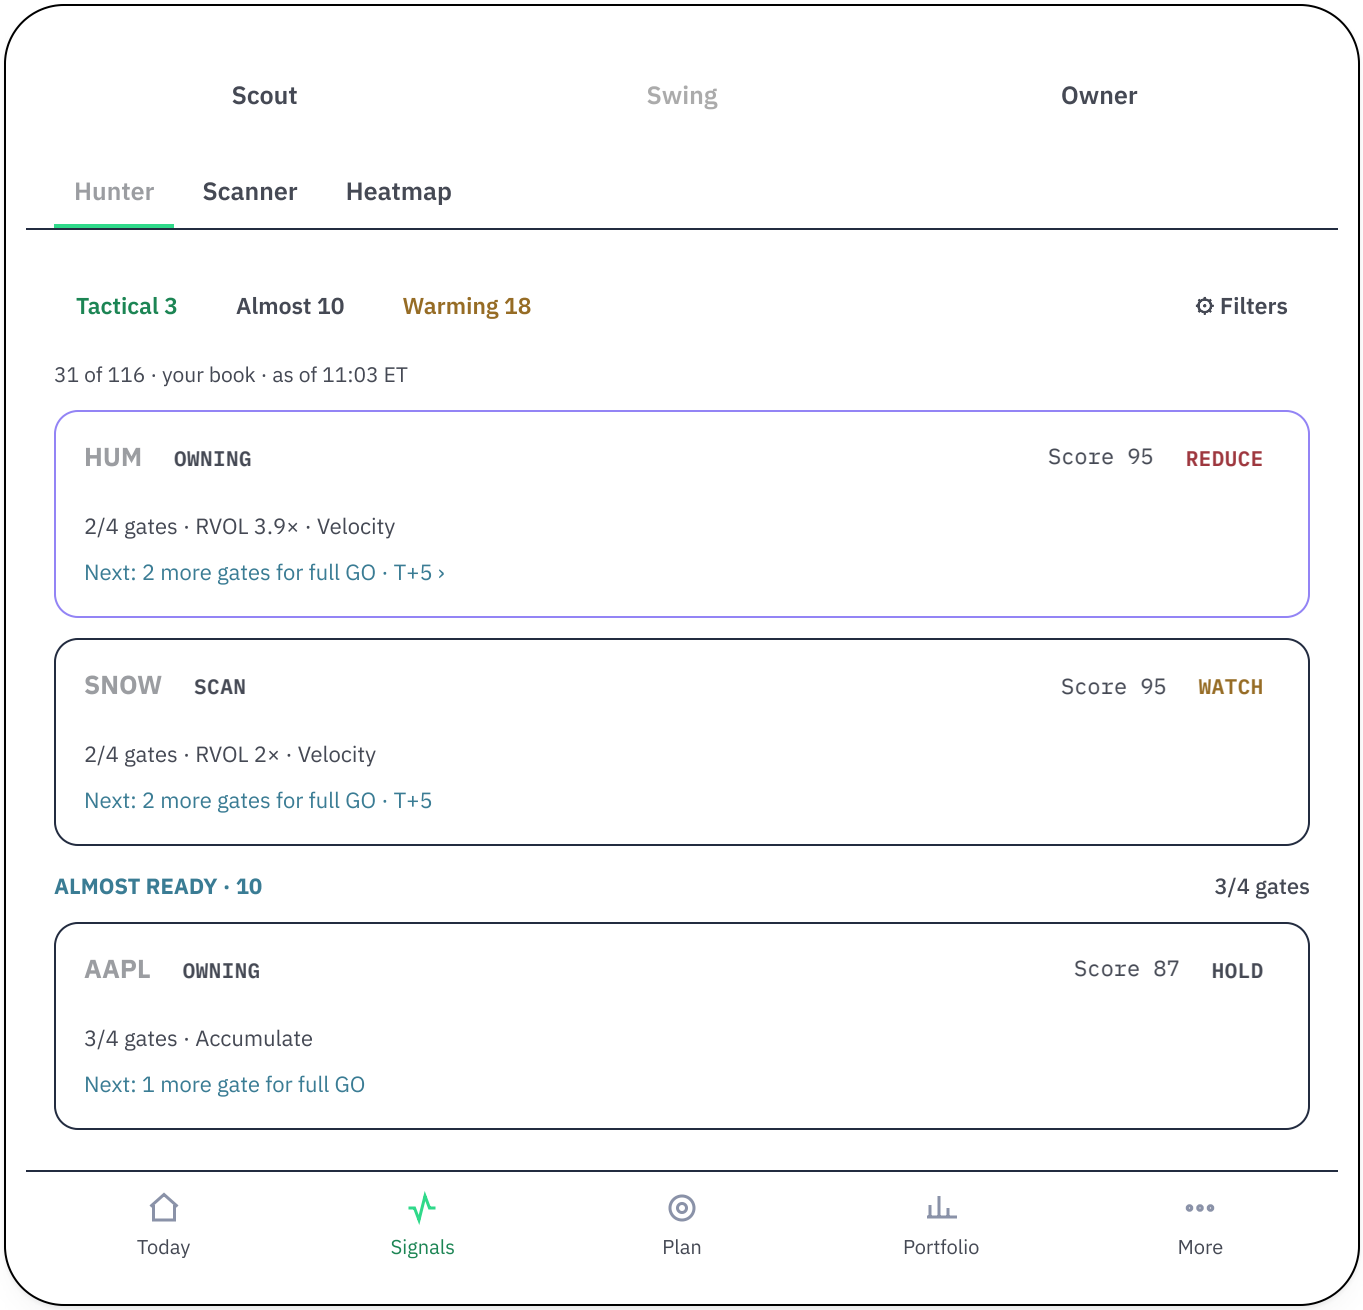

Holdings-first diff feed, your book, sector map, this week's calendar. Unchanged from the PDF — it was already right.

Signals — Hunter

Readiness tiers straight from `gates_passed` / `readiness_tier`. Gate dots use the same 4 primary gates as the ticker detail — never a different count.

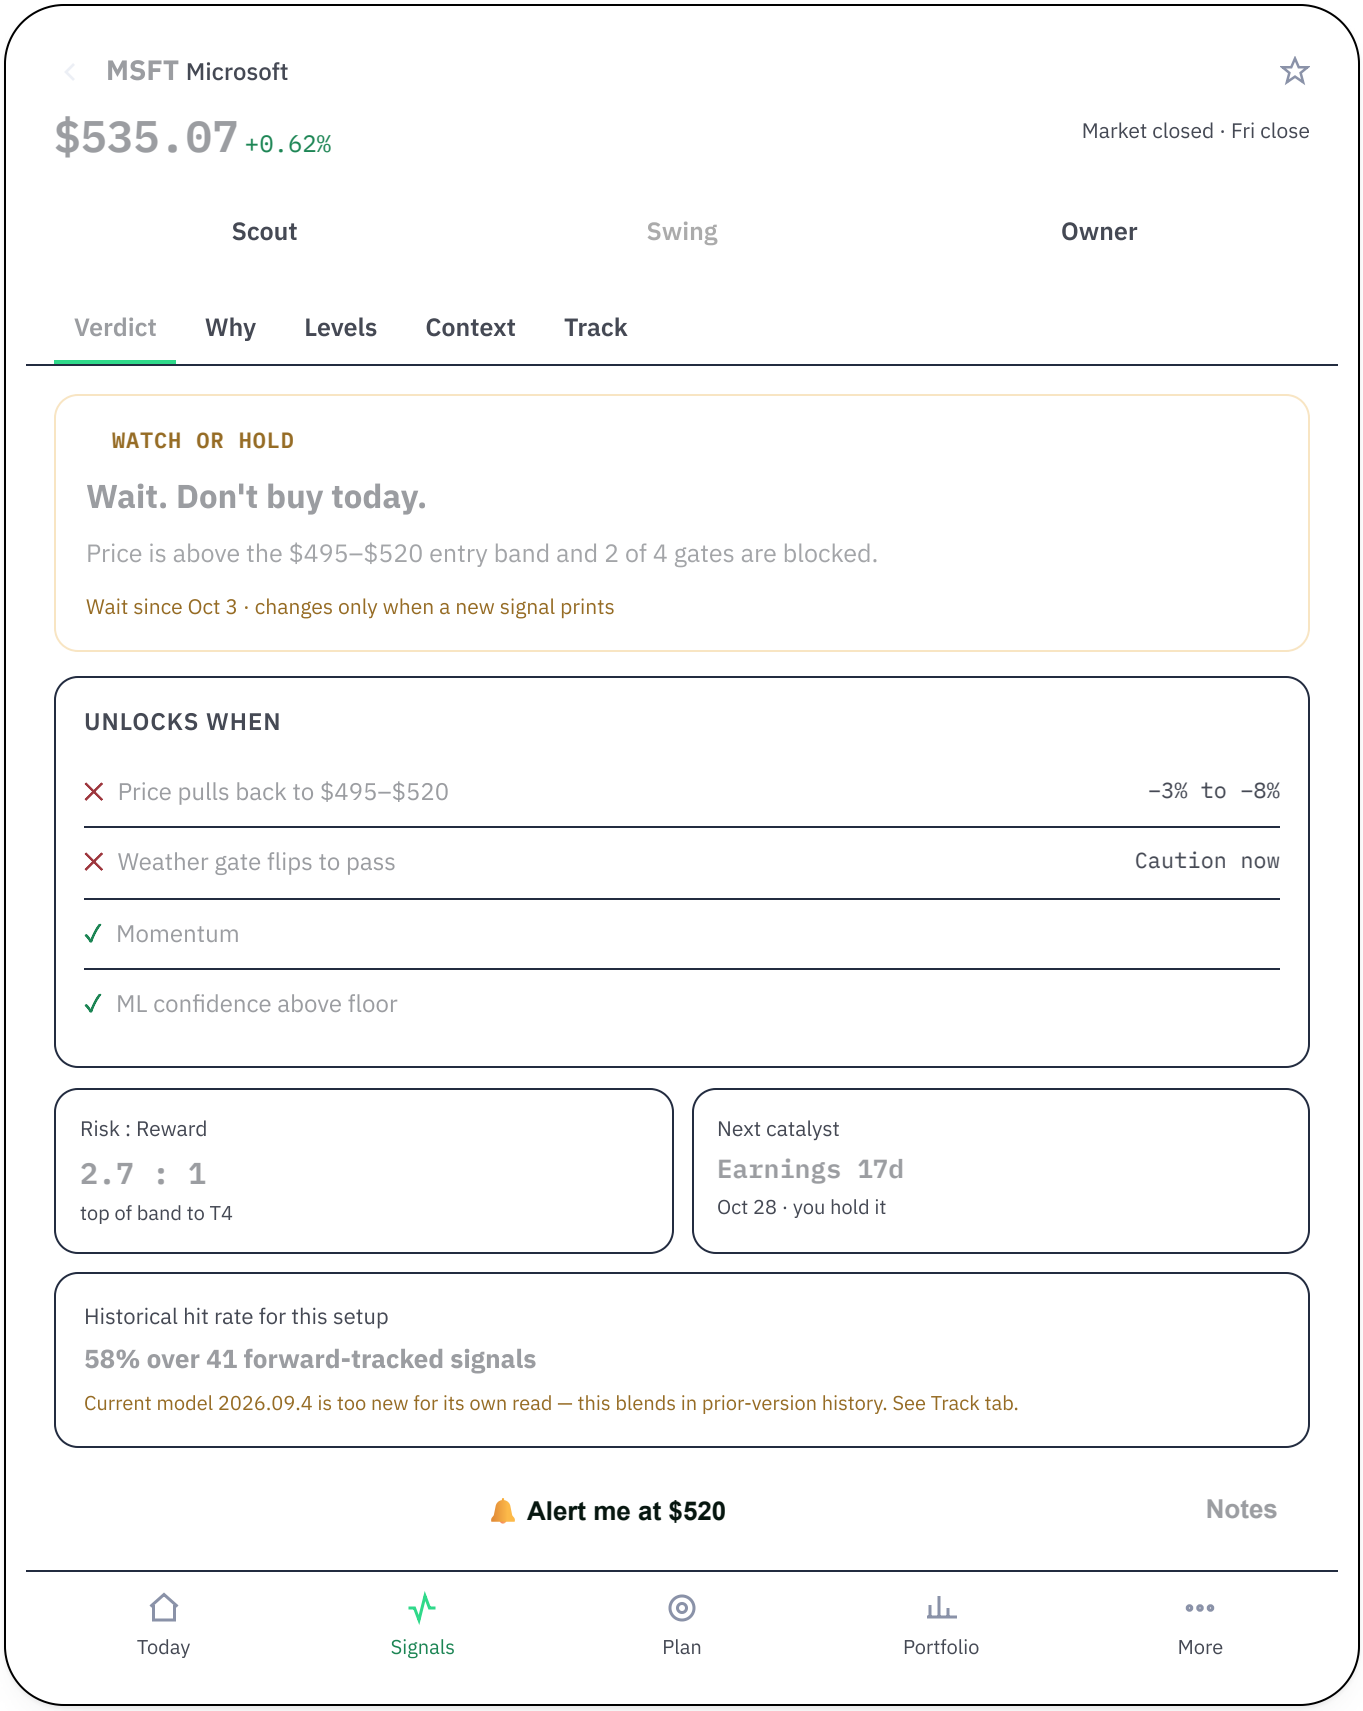

Ticker detail

Ticker detail

TRACK TAB FILLED IN

Verdict, Why, and Levels all read `investor_summary.horizons.medium` for this ticker — one record. Try each tab, and open the breakdown inside Why.

Portfolio

RISK + TAX-EXIT + JOURNAL ADDED

Example book (not your real holdings). Canonical home for Summary/Regime now — Today shows only a one-line teaser, fixing a verbatim-duplicate card that exists on both tabs today.

Total value · 15 holdings (example)

$65,146

CONCENTRATED

NVDA is 54.2% of the book. Top 3 holdings are 74.5%.

NEEDS ATTENTION

NVDA ›

Concentration

54.2% of book, above your 20% limit

HOLDINGS — Weight ▾

NVDA	$35,309 · 54.2% · +420.4%	Hold
META	$7,187 · 11.0% · +197.0%	Trim
GLD	$6,046 · 9.3% · −3.8%	Trim
AMD	$3,041 · 4.7% · +481.9%	Trim

RISK MANAGEMENT — New home

95% VaR / CVaR
−$4,890 / −$6,730

−20% SPY shock
−$9,112

Already computed by Portfolio Doctor today, just never surfaced as its own card — see Full risk report ›

TAX-AWARE EXIT — NVDA TRIM — New

Long-term gain · lot-level — selling the Mar 2024 lot saves $1,180 in tax vs. FIFO at today's size.

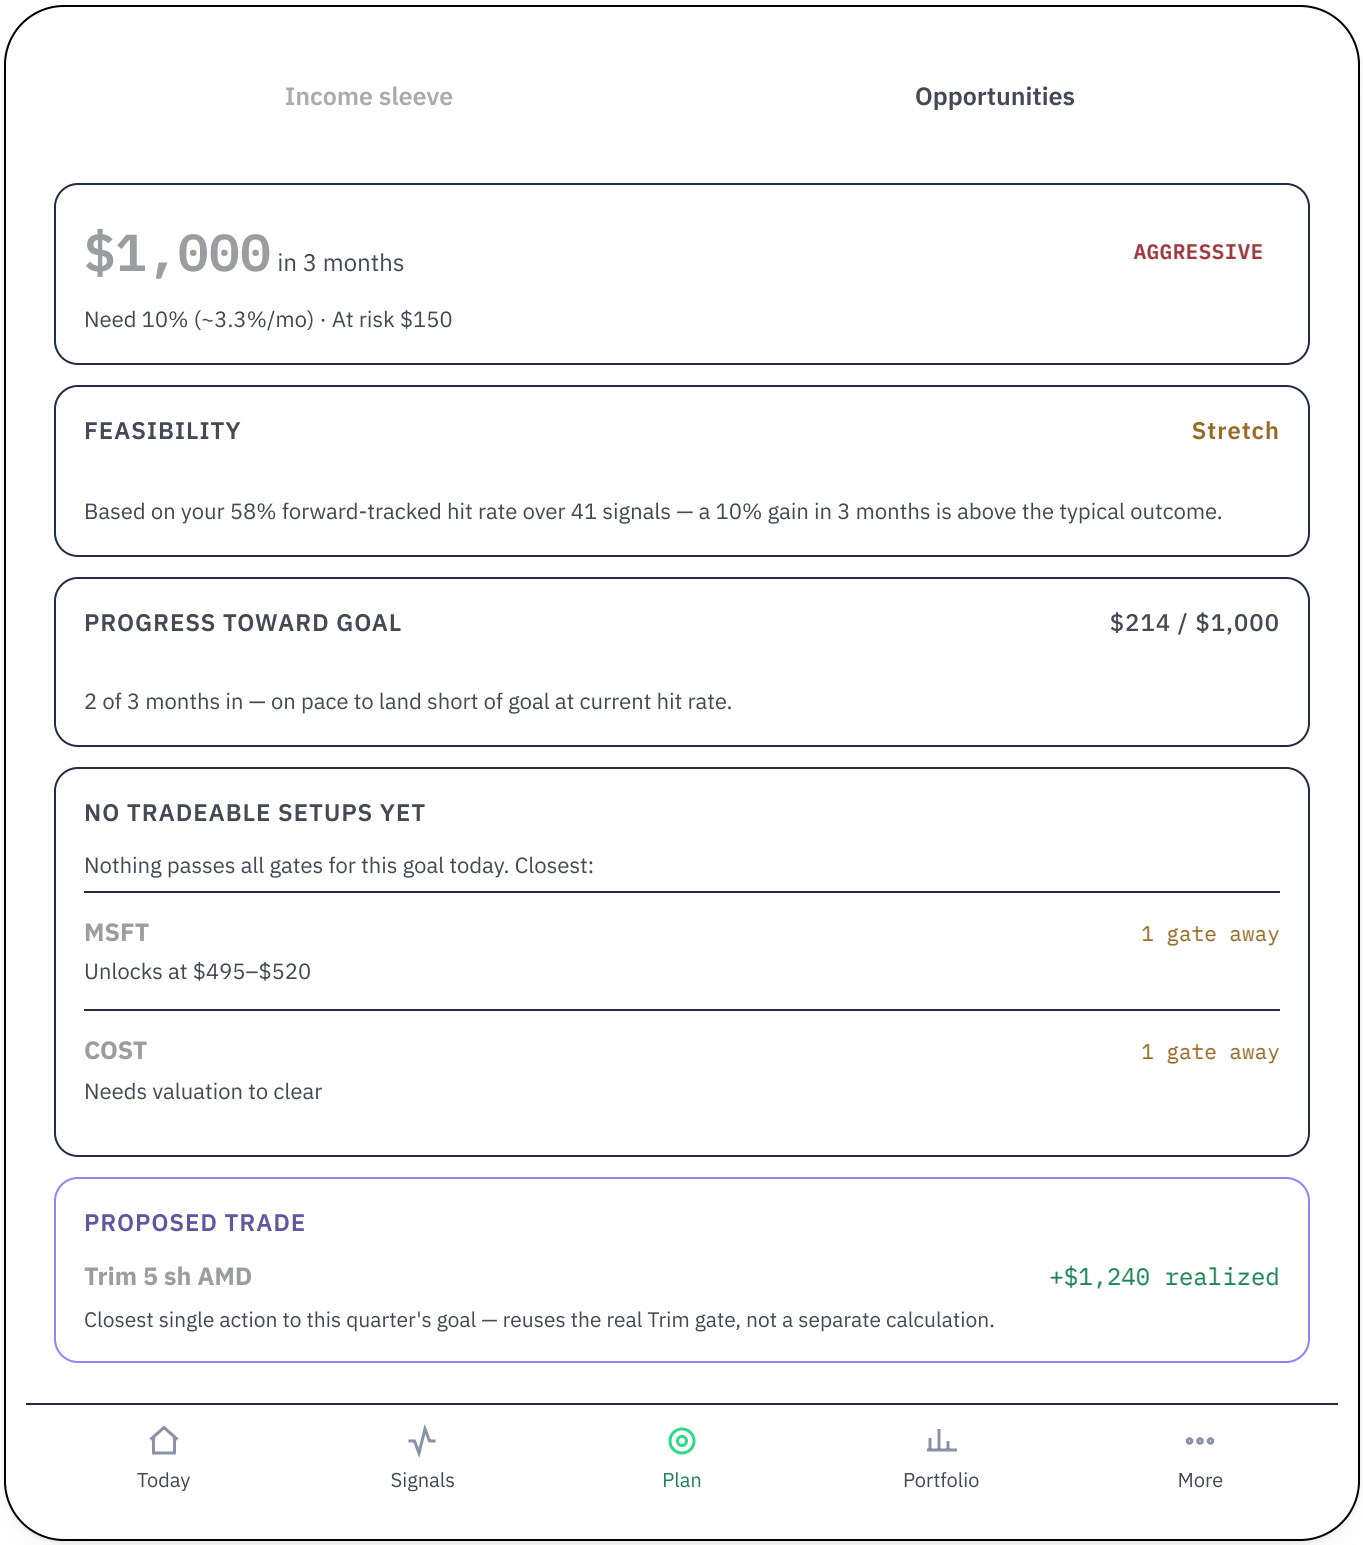

DECISION JOURNAL — + Add note

"Trimmed META into strength — thesis intact, just rebalancing." — Oct 6

Today · Signals · Plan · Portfolio · More

Plan

The old Income tab already does progress tracking and proposed trades, richer than the PDF's plain feasibility bar — kept, not reinvented. Feasibility is computed from the real forward-tracked hit rate. "Nearest miss" reuses the same gate-distance logic as Signals.

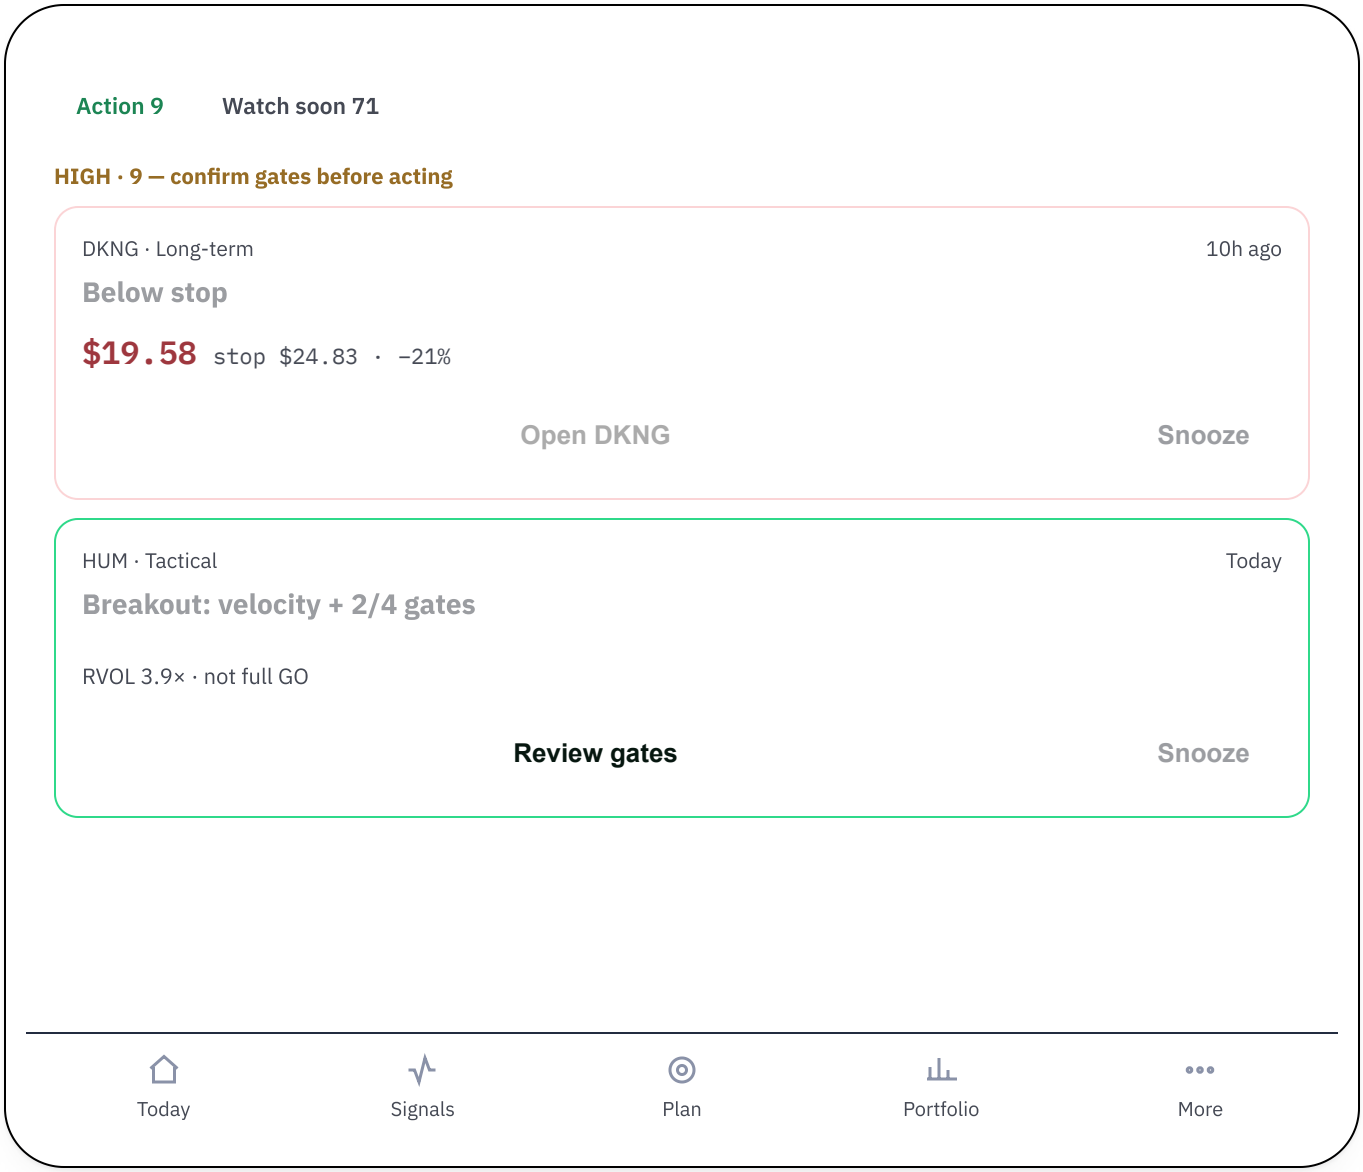

Alerts (from bell icon)

PROMOTED FROM OVERVIEW

Correction from the codebase audit: this already exists today as an AlertsPanel card on

Overview — not a new build. What's new is a dedicated full-screen destination with its own snooze/dismiss state, instead of a card competing for space in the diff feed.

04 The PDF is mobile-only — the live app is desktop today

Every screenshot from this session's work has been the wide desktop layout; the wireframe is a phone. Both need to exist, built from the same five-tab IA:

Desktop: three columns, not one stacked feed

Today / Signals / Plan keep a persistent left rail (the 5 tabs + mode switcher, always visible, not a bottom bar) and gain a third column: whatever the middle list is scrolled to previews on the right — the exact split-pane pattern already live in Signals' row-click-to-preview, just made permanent instead of a drawer.

Ticker detail: tabs become a sidebar, not a swipe

Verdict / Why / Levels / Context / Track stack as a left-hand list at desktop width, each one visible without losing place in the others — closer to how the Why tab's gate cards already read as a checklist than to a mobile tab strip.
